Literature Search Guide

Find 15-20 real, relevant, verified papers for the Related Work section

RULE: AI tools sometimes invent papers that sound real. Never put a reference in the paper unless you opened it yourself (publisher page, IEEE Xplore, Scholar or DOI link) and checked the title, authors, year and venue.

1. Where to search (free for students)

- Google Scholar (scholar.google.com): best for broad search; use 'Cited by' to find newer related work.
- IEEE Xplore (ieeexplore.ieee.org): our conference publishes there; your college may give free access. Browse the earlier CompSIF proceedings to see the style: https://ieeexplore.ieee.org/xpl/conhome/1856252/all-proceedings
- Semantic Scholar, ScienceDirect, MDPI, Frontiers, arXiv (arXiv is fine to cite, but do NOT post our own paper there: it causes desk rejection).
- Ask your college library about VTU e-library / IEEE access.

2. Search phrases to try

- tomato leaf disease detection deep learning MobileNet
- plant disease detection field images domain gap PlantDoc
- lightweight YOLO plant detection edge device
- ESP32-CAM plant disease detection
- agricultural robot crop monitoring IoT camera sensors
- IoT smart farming rover soil moisture camera
- pan-tilt camera plant monitoring robot
- LoRa 4G cellular IoT agriculture field monitoring latency
- plant disease severity estimation leaf lesion segmentation
- PlantVillage generalisation field conditions

3. How to pick papers

- Prefer the last 5 years, with a few classic ones (e.g. YOLO, MobileNet, PlantVillage).
- Prefer IEEE, Elsevier, Springer, Frontiers, MDPI journals/conferences with real peer review.
- Aim for 4-5 on plant disease deep learning, 3-4 on lightweight models, 4-6 on IoT/agricultural robots, 2-3 on communication links, 1-2 on severity estimation.
- For each paper note what it did, which dataset, key result, and the gap compared to us: AgriVision is a low-cost rover with sensors AND a two-stage vision pipeline evaluated across lab and field images.

4. Fill the literature table

Use `Templates/literature_table.csv`. The 'verified' column must be 'y' before a row can be used. Our draft already cites 8 classic papers (Mohanty 2016, Hughes 2015, Singh 2020 PlantDoc, Ferentinos 2018, Kamilaris 2018, Redmon 2016, Ultralytics YOLOv8, Howard 2019 MobileNetV3); please also open and verify those 8 first.

5. Writing the related-work text

Group by theme (not by paper). Each paragraph: what the group of papers did, then one sentence on its limitation relative to our setting. Paraphrase in your own words; never copy sentences. Keep to the reference style of IEEE: [1], [2]. Prompt 7.1 and 7.2 help with structure, but you write and verify the content.
